Young Environmental Leaders Creating
Lasting Change!

From Student Research to Published Environmental Advocacy

What began as a student-led sustainability project has evolved into a recognised environmental initiative with real-world impact, national visibility, and the potential to influence local restoration efforts.

The project has now been officially registered as a European Climate Pact Satellite Event, recognising its contribution to climate awareness, environmental stewardship, and community engagement.

HEAR FROM THE PROJECT MENTOR..

Anum Farooq

“What the students have achieved is tremendous: intergenerational interviews, primary data collection, independent fieldwork and restoration plans, as well as becoming published and producing legacy media for sustainability. This is something that takes months, if not years to achieve, and the students led themselves to complete this. We have also contacted their local councils to see if they would like to facilitate the restoration plans and are awaiting their response.”
